

What is the optimal capacity configuration model for a grid-connected microgrid?

An optimal capacity configuration model of the grid-connected microgrid is proposed, which comprehensively considers economic cost, renewable energy utilization efficiency and carbon emissions. Through the combination with the previous work, it provides a new solution to the problem of microgrid planning.

How much energy storage capacity does a microgrid have?

The total capacity of individually configured energy storage systems for each microgrid is  $106.49 + 140.30 + 193.375 = 440.165$  kW, which is significantly higher than the capacity of the shared energy storage station at 366 kW.

Can shared energy storage systems be used for multiple microgrids?

Therefore, the study of capacity configuration of shared energy storage systems for multiple microgrids is of great significance to improve the integration level of distributed energy sources and the economic operation of the system.

What is microgrid capacity planning?

Microgrid is considered an efficient paradigm for managing the massive number of distributed renewable generation and storage facilities. The optimal microgrid capacity planning is a non-trivial task due to the impact of randomness and uncertainties of renewable generation sources, and the adopted energy management strategies.

Is there a capacity planning solution for grid-connected microgrid based on scenario generation?

This paper presented an optimal capacity planning solution for grid-connected microgrid based on scenario generation considering multi-dimensional uncertainties. The efficient DCGAN based scenario generation method is developed to describe the uncertain behaviors of renewable power generation.

What factors affect the configuration of energy storage in microgrids?

The fluctuation of renewable energy resources and the uncertainty of demand-side loads affect the accuracy of the configuration of energy storage (ES) in microgrids. High peak-to-valley differences on the load side also affect the stable operation of the microgrid.
